Why does the tilt angle of PV panels change?

The optimum tilt angle at the same location changes periodically (Fig. 7) due to the Earth revolution around sun. In summer, when the sun shines more directly on the northern hemisphere, the tilt angle is generally small; winter is the opposite. Adjusting the tilt angle of PV panels according to the season helps capturing more energy.

Why is tilt angle important for solar panels?

In China, solar photovoltaic (PV) installations in power plants and on rooftops are experiencing rapid growth and will continue for the next decades . Tilt angle is a critical parameter for installing PV panels. To maximize power generation, tilt angle should be adjusted to ensure that PV panels are exposed to direct sunlight.

What is the optimal tilt angle for PV panels?

For example, some suggested that the optimal tilt angle for PV panels is exactly the same as the latitude [ , , ]. But it has also been suggested that the optimal tilt angle for annual use should be equal to the latitude minus  $10^\circ$  , or the latitude plus  $10^\circ$  and plus  $20^\circ$  .

Are non-optimized tilt angles affecting PV power output?

To quantify the potential losses associated with using non-optimized tilt angles, we calculate the annual PV power output for each PV plants in China using the optimized tilt angles and compare it with the power output obtained using the best-performing latitude-dependent scheme.

How do atmospheric factors affect optimum PV tilt angles?

Nicolás-Martín et al. presented a model for the annual optimum tilt angle as a function of latitude, diffuse fraction and albedo in the absence of meteorological data. These studies revealed that coupling more atmospheric

factors can achieve better performance in estimating the optimum PV tilt angles.

Does coupling more atmospheric factors improve optimum PV tilt angles?

These studies revealed that coupling more atmospheric factors can achieve better performance in estimating the optimum PV tilt angles. However, the simulation results were obtained by maximizing the amount of incident solar radiation on PV panel surface, without considering the actual photoelectric conversion process and PV system losses.
