Overview

Can you grow crops under photovoltaic panels?

Research indicates that growing crops beneath photovoltaic displays can actually yield a distinct set of agricultural and environmental benefits. Thanks to the shade provided by the panels, for example, the soil can retain more water, meaning it needs less irrigation.

Can solar panels help grow crops?

In the study, monitors were placed above ground level and at a depth of 5cm. Researchers from the University of Arizona have claimed growing crops in the shade of solar panels can lead to two or three times more vegetable and fruit production than conventional agriculture.

Can solar panels shade large crop lands?

And while the grass under your trampoline grows by itself, researchers like me in the field of solar photovoltaic technology — made up of solar cells that convert sunlight directly into electricity — have been working on shading large crop lands with solar panels — on purpose.

Could solar panels make agrivoltaics more efficient?

Translucent solar cells that split the light spectrum could allow for more productive use of arable land. Researchers say they have determined a way to make agrivoltaics — the process of growing crops underneath solar panels — more efficient.

Can solar panels be used in greenhouses?

The shade from the panels protects vegetables from heat stress and water loss. This has resulted in rural farmers being able to grow a greater range of higher-value crops. The project effectively harvests the power of the sun twice, the researchers say. If solar panels can be added to greenhouses, the results could be especially transformative.

What happens if you put vegetation under solar panels?

Placing abundant vegetation under panels leads to an increase in ground shade and humidity, which, in turn, leads to cooler photovoltaic cells and higher energy yields. One recent study found that panels with vegetation beneath them generated 10 percent more energy than those that had been placed over gravel.
