There are a number of solutions competing with DMF at the moment. I'd take a look at what's on the market and what admin overhead they have. When it comes to primarily storage I think you need to take a hard look at your data use

patterns. For instance, lustre tends to choke when hit with many small data requests.

Parallel file systems. When your computational needs exceed your storage performance, it's time to consider deploying a parallel file system. With features like discrete metadata storage, multiple parallel read and write servers, native file system clients, and accelerated MPI-IO, a parallel file system provides the performance you need for HPC, big data, and AI/ML workloads.

Simulation of Large-Scale HPC Storage Systems

This work identifies challenges posed by the design and validation of a storage simulator and proposes solutions implemented in F IVES, a simulator of HPC workloads on platforms that comprise a parallel file system. --As the scale of production HPC platforms increases, so does the computing and I/O performance gap, exacerbating the storage bottleneck. But there is more: huge amounts of data are created around the clock - they need to be written and read continuously. This is why the faster storage system underneath, the quicker

the HPC system gets in total. Parallel filesystems in combination with enabling technologies are the best choice for HPC, AI and Machine Learning workflows.
