Microgrid composition and background

Overview

Generally, an MG is a small-scale power grid comprising local/common loads, energy storage devices, and distributed energy resources (DERs), operating in both islanded and grid-tied modes. How are microgrids categorized?

Microgrids can be categorized via different aspects ranging from the structure such as DC, AC, or hybrid to control scheme such as centralized, decentralized or distributed. This chapter reviews briefly the microgrid concept, its working definitions and classifications.

What is Microgrid technology?

Microgrid is an effective way for connecting distributed generation to the power grid. Microgrid technology, as a key technology for renewable energy generation and distribution, has attracted more and more attention from countries and regions in the context of the environmental problems and energy crisis now.

What is the layered structure of a microgrid?

The layered structure of the microgrid is explained followed by brief explanation of modes of operation, control, and hierarchical control scheme of the each microgrid. The concept and modeling of PV, MPPT algorithms, wind turbine system, batteries, and FC is also discussed.

Can Microgrid technology integrate the advantages of distributed generation?

Abstract: Microgrid technology can effectively integrate the advantages of distributed generation, and also provide a new technical way for large scale application of grid-connected generation of new energy and renewable energy.

What are the challenges of microgrid development?

The development of microgrid has been fraught with challenges of low inertia, renewable energy uncertainty, load complexity, and communication

integration reliability. The system-level control and stability issues with microgrid are urgently in need for research.

What is the difference between microgrid and distributed resource?

Generally, microgrid is the composition of distributed generation (DG), loads, ESS, PECs, and control devices; but the basis of microgrid is distributed resource (DR) that is the summation of DGs and ESS, that is, $DR=DG+ESS$.
