Photovoltaic panels installed on snowy mountains

Overview

In the depths of winter, panels placed at an optimal orientation on snow-covered mountains produced up to 150% more power than panels in urban locations, the authors found. *Nature* 565, 269 (2019) Should solar panels be installed on snow-covered mountains?

The placement of solar panels on snow-covered mountains can boost the production of electricity when it is most needed — in the cold, dark winter. Solar-power systems have long been hampered by a seasonal problem: the panels produce more energy in summer than in winter, at least in the mid-latitudes, where much of the planet's population lives.

Can solar panels be installed in snow?

The thought of installing solar panels in isolated, snow-bound regions with harsh weather conditions may seem far-fetched. But Himachal Pradesh, a hilly state in northern India where snow and sun abound, is about to break new ground.

Can solar power be installed in a snowbound area?

The state plans to set up a one-gigawatt solar power plant in the Spiti Valley, an area that typically sees more than 300 clear and sunny days in a year but remains snowbound for up to a third of the year. Installing solar power plants in snowbound areas offers an important avenue for reducing pollution and mitigating climate change.

Why do photovoltaic panels get covered by snow?

When photovoltaic panels are covered by snow, the heat generated in the semiconductor region inside the photovoltaic module due to the energy level difference of the pn junction and the resistance of the semiconductor can be utilized as 'load' for the photovoltaic cells.

Can photovoltaic panels remove snow?

Photovoltaic panels can remove snow when the snow thickness is greater than the equivalent height and the inclination angle is greater than the required minimum inclination angle. Experimental studies have shown that the method proposed in this paper achieves this purpose for such conditions.

Should solar panels be installed vertically?

Installing the panels vertically — which allows snow to slide off — enhanced their output even more. In the depths of winter, panels placed at an optimal orientation on snow-covered mountains produced up to 150% more power than panels in urban locations, the authors found.
