Power electronics in microgrids

Overview

What is a power electronic converter in a microgrid?

Figure 1. Power electronic converters in microgrids. In an AC microgrid, power electronic converters are used to convert DC power (from PV cells, batteries, EVs, etc.) or variable frequency AC power (from wind turbines) into 50/60 Hz AC power so that the power can be fed into the AC bus and supply loads.

Is microgrid a viable alternative to traditional power system?

Increased penetration of DER units and wide spread use of renewable energy sources challenge the entire architecture of traditional power system. Microgrid, characterizing higher flexibility and reliability, becomes an attractive candidate for the configuration of future electrical power system.

Are microgrids a key to a more intelligent and flexible power system?

Finally, future trends of microgrids are discussed pointing out how this concept can be a key to achieve a more intelligent and flexible power system. Wang, X., Blaabjerg, F., & Chen, Z. (2012). A Review of Power Electronics Based Microgrids.

How does a microgrid work?

Basically, microgrid operates in two modes: (a) isolated, and (b) grid connected. Over the last decade, distributed energy resources (DER) technology has undergone a fast development. Increased penetration of DER units and wide spread use of renewable energy sources challenge the entire architecture of traditional power system.

Are power electronic converters a building block of microgrids?

The Energy Internet: An Open Energy Platform to Transform Legacy Power Systems Into Open Innovation and Global Economic Engines. Duxford, UK: Woodhead Publishing; 2019. pp. 123-152 Submitted: 18 July 2021 Reviewed: 30 September 2021 Published: 15 December 2021 Power electronic

converters are indispensable building blocks of microgrids.

What is a microgrid (MG)?

A microgrid (MG) is a stand-alone or grid-connected hybrid renewable system that uses distributed renewable and nonrenewable energy sources and energy storage systems (ESSs) to supply power to local loads.
