Solar power generation tungsten rod

Overview

What is a tungsten based absorber?

In the proposed tungsten based absorber for visible regime, the structure contains a ground plane made up of a metal underneath a dielectric layer which in turn is below a resonating structure made up of a same metal as ground plane (metal-dielectric-metal) as shown in Fig. 1. The dielectric layer is made up of silicon dioxide (SiO_2).

Why is tungsten used in nanostructure layer?

Major motivation behind the research is introduction of tungsten (W) for nanostructure layer which has higher melting point than any other metal i.e. Gold (Au), Silver (Ag), Chromium (Cr), Copper (Cu) and even Titanium Nitride (TiN) which is a refractory material.

Can solar thermophotovoltaic devices improve the performance of solar energy harvesting?

Provided by the Springer Nature SharedIt content-sharing initiative Solar thermophotovoltaic devices have the potential to enhance the performance of solar energy harvesting by converting broadband sunlight to narrow-band thermal radiation tuned for a photovoltaic cell.

What is the relative permittivity of tungsten?

The imaginary part of relative permittivity of tungsten increases from 16 to 22 and for 400–700 nm (approximately) and then decreases to about 19 at 800 nm as shown in supplementary Fig. S1.

How does a thermal spectral converter work in a low-bandgap solar cell?

For the low-bandgap cell ($E_g = 0.55$ eV), the heat generated in the cell during the solar PV process is due to thermalization (down to E_g) of nearly the entire solar spectrum. The presence of a thermal spectral converter reduces the normalized heat generation in the cell by a factor of ~ 3 .

Why is cross alignment optimum for tungsten?

The proposed designs are two-dimensional, polarization insensitive, broadband and are predicted to give better response under high temperatures ascribed to high melting point of tungsten i.e. 3422 °C. Amongst these designs, cross alignment is found optimum for tungsten, because it is impedance matched with the free space for visible spectrum.
